COMMISSION REDUCES FLOOD RELEASES FROM FALCON DAM

The International Boundary and Water Commission, United States and Mexico, reduced the release of floodwaters from Falcon Dam, located at Falcon Heights, Texas-Nueva Ciudad Guerrero, Tamaulipas on August 2, 2010. Releases were reduced on August 2 from 46,000 cubic feet per second (1300 cubic meters per second) to 30,000 cubic feet per second (860 cubic meters per second). With relatively dry conditions prevailing in most of the Rio Grande basin, inflows to the dam have dropped considerably and the reservoir elevation is declining. However, scheduled releases from Mexican reservoirs that discharge into tributaries downstream of Falcon need to be marginally increased. The U.S and Mexican Sections of the IBWC in conjunction with the National Weather Service are collaborating on all releases to the Rio Grande. The reduced releases from Falcon will improve conditions at some downstream communities. Further evaluations of the inflows to Falcon Dam will continue throughout the week for possible further reductions.

Even with the reduced releases from Falcon Dam, residents downstream should continue to monitor National Weather Service warnings and forecasts for updated information and river forecasts concerning flood conditions.
